

Offsite Data Backup For Your Business

Know Your Business Data Is Safe and Recoverable

Where do you save critical information? A survey by Ontrack has shown the major causes of data loss to be hardware malfunction and human error (82% of the cases), followed by software corruption, Virus, and natural disasters. When it comes to backing up your data, not having a plan is planning for disaster!

How IronOak IT Offsite Backup Works To Secure Your Business Data:

IronOak IT OBS (Offsite Backup Manager) installed on any computer runs scheduled backups. The data is transferred via an encrypted internet channel to IronOak Offsite Back-Up Server.

A Laptop equipped with IronOak ACB (A-Click Backup), runs independent from the rest of your network, so your data created when traveling is secured.

The IronOak OBS (Offsite Backup Server) receives your backup data already encrypted, and stores it under your business account. Your data is only retrievable and accessible to you (Not even IronOak Staff can see it) since you hold the encryption key.

The IronOak Replication Server is an extra layer of security. All data housed on the IronOak OBS is replicated to this server located in different physical location on a daily basis. This ensures your data is recoverable even in the unlikely event that the original OBS server becomes unavailable.

IronOak backup clients run on Windows, Mac, Linux, Netware, AIX, HP-UX and other systems. We can backup your files, disk images, Outlook .pst, Exchange servers, MS SQL, MySQL, Domino and more.
